Acetabular Reaming

Use reamer to prepare acetabular implant site. Hold reamer steady and apply pressure in the same direction that the prosthesis will be implanted.

Component Sizing

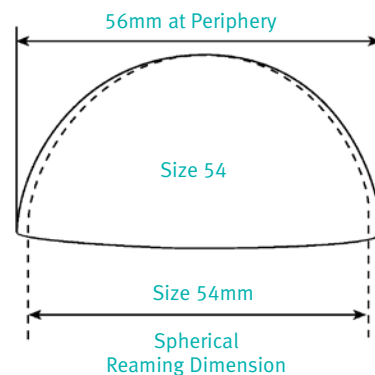

Provisional shell sizes match the outside dimensions of the acetabular reamers. The elliptical *Trabecular Metal* Modular Acetabular Cup provides 2mm of interference fit at its periphery if the labeled cup size matches the last reamer size used. For example, the 54mm acetabular cup has an outer diameter of 56mm at its rim, but matches the height of the reaming at the polar dome of the cup.

Note: The amount of press fit used should be determined at time of surgery and be based upon bone quality.

Select the provisional shell that is the same size as the last even-numbered reamer used. Thread the provisional shell onto the positioner securely. Impact the alignment connector to engage onto the taper. Tighten Locking Nut.

Optional MIS Offset Reamer Handle
00-7804-080-00

Provisional Shell Positioning and Alignment

Ensure the patient is in the correct position. With the Provisional Shell connected to the positioner, insert the Provisional Shell into the prepared site. Keep the slaphammer portion of the positioner vertical, and “A-Frame” or “Gunsight” extension parallel with the patient’s body, to achieve 45 degrees abduction and 20 degrees forward flexion.

Note: The Provisional Shell has protruding, 1mm teeth around the rim for stability during trial reduction. It also has fenestrations so that cup seating can be assessed.

Provisional Liner and Trial Range of Motion

Select the Provisional Liner size that matches the previously selected Provisional Shell. Perform trial reduction. After determining the appropriate style, face angle, and position, mark the bone opposite the positioning mark on the liner. This mark serves as a reference later when positioning the Acetabular Cup.

Optional: The Provisional Liner Polar Screw can be used to lock the Provisional Liner and Provisional Shell together during trial reduction.

Warning: Do not impact onto the Provisional Liner as damage may occur.

Provisional Liner and Shell

Positioner Assembly

Thread the implant onto the positioner securely. Position alignment connector as shown. Alignment connector should be in line with locking ring access. Impact alignment connector to engage onto the taper. Tighten Locking Nut. Impaction will be applied primarily to the dome of the implant.

Alternatively: The Rim Impactor can be utilized. Remove the cap from the Cup Positioner and replace with the Rim Impactor. The Rim Impactor size should correspond with the implant size selected. The implant should be threaded onto the positioner securely. Impaction will be applied primarily to the rim of the implant.

Warning: Use caution to avoid impacting the anti-rotational tabs on the rim of the implant.

Implant Positioning and Alignment

Ensure the patient is in the correct position. With the final prosthesis connected to the Acetabular Cup Impactor/Positioner, insert shell into the prepared site. Keep the slap hammer portion of the positioner vertical, and "A-Frame" or "Gunsight" extension parallel with the patient's body, to achieve 45 degrees abduction and 20 degrees forward flexion.

Implant Orientation

The potential for neurologic and vascular injury can be minimized if the posterior quadrants are used for trans-acetabular screw placement.* The cluster-holed shell should be positioned to allow screw placement in the posterior superior and/or posterior inferior quadrants of the acetabulum.

* Wasielewski RC, Cooperstein LA, Kruger MP, Rubash HE. Acetabular anatomy and the transacetabular fixation of screws in total hip arthroplasty. *J Bone Joint Surg.* 1990;72-A,4,501-508.

Implant Insertion

The “Gunsight” or “A-Frame” Alignment Guides can be used to aid in cup positioning. Use short strikes with a small mallet to impact the cup. The impact required to safely seat the implant is dictated by the bone quality. Due to impaction, it may be necessary to periodically re-tighten the collet or locking nut. Remove the “A-Frame” or “Gunsight” device during continued impaction. Use screw holes to determine if the shell is fully seated.

Optional Offset Shell Inserters
00-7804-025-20

Screw Insertion

If screw placement is desired, drill a pilot hole by placing the drill through the Drill Guide in the desired screw hole (A). Measure the hole's depth with the Depth Gauge (B).

Before inserting screws, attach the Torque Limiter to the Screwdriver (C). Avoid overtightening of screws and potential advancement through the shell screw hole. **Note:** The Torque Limiter does not eliminate the need for surgeon evaluation of bone quality, appropriate screw selection, and torque control.

Select the appropriate length screw and insert it in the hole with the Screwdriver (D). Place additional screws as necessary.

Warning: Avoid screw placement through the shell into the anterior inferior quadrant of the acetabulum to prevent injury to the neuro-vascular structures.

Liner Positioning

Insert Provisional Liner into prosthesis to check appropriate liner elevation. The anti-rotational slots on the trial liner should line up with the two anti-rotational tabs and black etch marks located on the rim of the shell. Clear all soft tissue from around the perimeter of the shell and assess visualization. To achieve complete congruency, dry inner shell thoroughly. Place the final poly liner with Liner Positioner, or by hand. Align with anti-rotational tabs. Ensure that both tabs are engaged with prosthesis liner slots.

Anti-rotational tab and slot misaligned

Correct vertical alignment

Shell and polar boss misaligned

Liner Insertion

Push the liner into the shell. Impaction may be necessary to fully engage liner into shell. Watch for the locking tabs to open and then close together. There will be a 2mm to 3mm gap between the locking ring tabs. The prosthetic liner is fully seated when the locking ring tabs can be moved from side-to-side with a probe. The ring serves to lock the liner in place. It must float freely inside the shell to function properly.

A
Before Insertion

B
Insertion

C
Locked

D
Fully Seated (side-to-side check)

Locking Ring Replacement (if required)

If upon inspection, it is determined that the locking ring is not functioning properly or has become damaged, it must be replaced. If seated, the liner is removed using the Disassembly Device to open the ring, while at the same time using the Liner Extractor to clamp and lift the liner out of the shell.

To remove the old ring, push the ring to the side of the shell and grab the exposed portion on the opposite side of the shell. A firm and steady grip is required. To insert a new ring, first insert the tabs of the ring into the locking ring window. Then, press the ring into place. When properly seated, the ring will first pop into place and then float freely in the shell. Liner assembly can now take place.

Final Reduction

Perform final reduction to assess range of motion, hip stability, and limb length. If “fine tuning” or a different liner style is needed, use the Disassembly Device to remove the liner.

Ordering Information

Trabecular Metal Acetabular Shells

SHELLS are available in 2mm OD increments
